

Matthew Davoren

Software Engineer

Ventura, CA. 93004 | matthewdavoren@gmail.com | 630-310-7173

[LinkedIn](#) | [GitHub](#) | www.matthewdavoren.com

Backend software engineer with a passion for media systems. I specialize in workflow automation, internal web apps, API integration, and backend tools that support creative teams.

PROFESSIONAL AND TECHNICAL SKILLS

Languages: C++, Python 3, Go, Java 17, SQL, JavaScript (Node.js, TypeScript), Bash, HTML/CSS

Frameworks & Libraries: Node.js, Express, Spring Boot, React, Angular, Sidekiq, Make, FFmpeg

Dev Tools: Docker, Kubernetes, GitHub, Gitea, GitLab, Neovim, Tmux, VS Code, IntelliJ

Cloud/Infrastructure: AWS (S3, IAM, Lambda), GCP, MSSQL, PostgreSQL, Linux (Ubuntu, CentOS)

Methodologies: Agile (Scrum), Kanban

WORK EXPERIENCE

General Services Agency, Ventura County

Software Engineer - Python, Go, C++, Node.js, Typescript

07/2024 - Present

- Engineered a full-stack Node.js and Angular application supporting 20+ dynamic forms, queue management, and OSHA API integrations.
- Refactored file-processing automation logic in Go for performance benchmarking.
- Prototyped C++ tools to replace Python-based billing logic for improved runtime and deployment portability.
- Administered Linux servers and automated re-authentication to Windows shares using Kerberos, bash scripts, and cron jobs.
- Built a React-based vehicle registration system with backend PDF/email automation, reducing manual admin tasks.
- Wrote Python scripts with Make to automate ingestion of CSVs into MSSQL, reducing billing processing time by 75%.
- Improved code quality across the org by managing GitHub repo policies and enforcing Git best practices.
- Deployed a Linux-based FFmpeg media server with AWS storage, enabling transcoding and access to thousands of public assets.

National Football League (NFL), Los Angeles

Media Engineer - Java, PostgreSQL

06/2021 - 05/2024

- Developed Java tools with Maven, TreeMaps, and HashMaps to identify 23+ storage inefficiencies in Dell ECS object storage.
- Developed Java-based ingestion workflows for the NFL's media asset management (MAM) system to automate the intake of video, image, and document assets from various acquisition pipelines.
- Implemented automated metadata tagging using JSON parsing, filename conventions, and upstream system lookups to ensure compliance with NFL schema standards.
- Created modular, reusable Java workflow components using Spring and Maven for asset normalization, metadata enrichment, and validation.
- Integrated workflows with external APIs and internal databases to enrich assets with contextual data (e.g., game ID, team names, production tags).

- Built SQL-based Grafana dashboards to support game-day operations, improving visibility and response time by 50%.
- Debugged Java logs and JSON metadata to resolve critical system errors across video and image pipelines.
- Designed scalable AWS S3 storage tiers with IAM policies and lifecycle rules to optimize cost/performance across environments.

Spotify, Los Angeles
Media Manager

05/2019 - 06/2021

- Built media ingest workflows, including setting up and monitoring watch folders used for automatic tagging and delivery.
- Provided tier 1 support for editors and audio engineers by troubleshooting post-production software such as Adobe Premiere and issues related to storage access and permissions.
- Gained exposure to tools like OpenDrives and Telestream Vantage, supporting advanced transcoding and delivery processes.
- Acted as a technical liaison between internal teams and external partners to ensure consistent media transfer and access.

EDUCATION

Columbia College Chicago

Bachelor's Degree
